(Greek, trophe = "nutrition" and -blast, a primordial cell) In early development the blastocyst outer trophectoderm (TE) layer will generate all the extra-embryonic trophoblast cell types: cytotrophoblast, syncytiotrophoblast, trophoblastic column and extra-villous trophoblast cells. These cells have an important contribution to extra-embryonic tissues (fetal placenta and membranes) and processes of early development (adplantation, implantation and endocrine support of pregnancy).

Cells of the trophoblast lineage have thus been recovered from the uterine cavity and endocervical canal. An emerging non-invasive technology [trophoblast retrieval and isolation from the cervix (TRIC)] isolates and examines EVT cells residing in the cervix to explore their origin, biology and relationship to pregnancy and fetal status.

Origin of cervical trophoblast cells during placental development. The developing conceptus is shown within the uterus at the implantation site (a) and later during the placentation period of weeks 5-12 of gestation (b). EVT cells originate from trophoblast cell columns at the base of the anchoring villi, and follow the interstitial ...

The trophoblast. The syncytiotrophoblast derives from the fusion of cytotrophoblast cells. Through apoptosis (programmed cell death) of uterine stromal cells spaces are created through which the blastocyst penetrates further into the endometrium. The cytotrophoblast, on the other hand, consists of an irregular layer of ovoid...

Trophoblast. Trophoblasts (from Greek trephein: to feed, and blastos: germinator) are cells forming the outer layer of a blastocyst, which provide nutrients to the embryo and develop into a large part of the placenta. They are formed during the first stage of pregnancy and are the first cells to differentiate from the fertilized egg.

In this review, we infer that the patterns of serum IFN-γ levels found in pre-eclamptic patients could be related to the origin of the disease, since it has been reported that IFN-γ blocks trophoblast invasion (Hu et al., 2006), one of the early alterations seen in the placentation process of patients who develop pre-eclampsia.

Dr. Beard was first to report that in many respects this trophoblast in its early form, looks and behaves like a typical malignant tumor. It begins growing as a very undifferentiated offshoot of the primitive blastocyst (embryo at four days), its cells multiplying almost without control, as tumors were known to do even in Beard's day.

started to function, the trophoblast transformed from acting like an invasive tumor to acting like a well-behaved tissue - the placenta. Dr. Beard assumed that the then known pancreatic enzymes were the cause. However, Dr. Beard never actually isolated one or more substances and showed the isolated substance(s) to be the cause of the effect.

**Excerpt - The Trophoblast and the Origins of Cancer**  
The trophoblast develops processes that later receive a core of vascular mesoderm and are then known as the chorionic villi; the trophoblast soon becomes two layered, differentiating into the syncytiotrophoblast, an outer layer consisting of a multinucleated protoplasmic mass (syncytium), and the cytotrophoblast...
